

METAL GLASS TABLE

DESIGN /2013

Resulting from the marriage between the centuries-old tradition of blown glass and the industrial appeal of metal, Metal Glass recalls an alchemist's still or a lantern from a Gothic setting. It is distinguished by a dense and almost opaque transparency, which is achieved by pouring soda powder into the still-incandescent vitreous paste. The ensuing chemical reaction creates a myriad of bubbles which are transformed into luminous particles, when the lamp is on. The pyrex cylinder inside spreads the light while being part of the design. In the table version, the outer glass can be placed in both directions.
